

Lung Cancer Detection using Xception Learning

1. Accuracy Graph

This graph shows how the model's training accuracy and validation accuracy change over each epoch. Increasing and closely matching curves indicate that the model is learning effectively and generalizing well to unseen data.

2. Loss Graph

This graph shows the training loss and validation loss during the learning process. A decreasing loss indicates that the model's prediction errors are reducing and its performance is improving.

3. Classification Report

The classification report provides performance metrics such as precision, recall, F1-score, and support for each class. It helps evaluate how accurately the model classifies different categories of lung cancer images.

Classification Report:				
	precision	recall	f1-score	support
0	0.82	0.96	0.88	24
1	1.00	0.97	0.99	113
2	0.98	0.96	0.97	84
accuracy			0.97	221
macro avg	0.93	0.97	0.95	221
weighted avg	0.97	0.97	0.97	221

4. Confusion Matrix

The confusion matrix visualizes the number of correct and incorrect predictions made by the model for each class. It helps identify which classes are being classified correctly and where misclassifications occur.

Confusion Matrix
